Midland Combustion Pumping, Heating & Filtering Units

Specifically for the Quarry Industry

Midcom Duplex/Simplex Pumping and Heating Units have been designed and supplied to the Quarry Industry for many years. The unit as suggested combines the method of **Heating, Pumping** and **Filtration** together with oil temperature regulation and oil pressure control. Designed for use with any grade of oil that is available to the Quarry.

We supply all major quarries in the United Kingdom and Ireland with our products.

The Pumping and Heater Unit illustrated is for location outdoors in a very arduous environment. A weather shade is provided to shield the unit from the worst of the elements.

Normally the P&H Units incorporate at least one Electric Line Heater with specialized heating elements specifically designed for low grade oils. The electric facility provides a heated flow

of oil to satisfy the plant for all operating conditions. They have been proven in service for many years.

Midcom has been manufacturing heating equipment for the Quarry Industry for over forty years and the products have been proven in service during that time. The equipment is robust and capable of performing in the most arduous conditions. From time to time replacement parts will be required and extensive replacement parts are available at short notice to ensure the plant is kept running at all times.

All heaters are compliant with European Legislation covering CE markings / PED approved with basic design complying with PD5500 and / or ASME.

Products are run tested in the test cell before they leave the factory.
